

What Is Claimed Is:

1 1. A method of routing a plurality of demands in a network that comprises nodes
2 interconnected by links, each demand having two end nodes, the method comprising:
3 a) logically subdividing the network into a plurality of rings, wherein each ring is
4 formed by two link-disjoint paths between a pair of nodes;
5 b) to each of the demands, assigning a ring that contains both of the pertinent end
6 nodes; and
7 c) to each of the demands, assigning two mutually link-disjoint paths on the ring
8 from one end node to the other, wherein one said path is a working path and the other
9 said path is a protection path.

1 2. The method of claim 1, wherein each of the protection paths is node-disjoint
2 from its corresponding working path.

1 3. The method of claim 1, further comprising, for at least one pair of end nodes,
2 subdividing a total demand between said end nodes into a plurality of unit demands, and
3 wherein the assigning of working paths and protection paths is performed on the unit
4 demands.

1 4. The method of claim 3, wherein the network is an optical network, each link of
2 the network comprises one or more optical fibers, and one unit of demand is equivalent to
3 the bandwidth capacity of one wavelength channel on an optical fiber.

1 5. The method of claim 1, wherein each working path and each protection path is
2 confined to a single ring.

1 6. The method of claim 1, wherein the network is an optical network, and the
2 method further comprises assigning at least one wavelength channel to each working path
3 and to each protection path, resulting in a working wavelength channel on the working
4 path and a protection wavelength channel on the protection path.

1 7. The method of claim 6, wherein the assignment of wavelength channels is
2 carried out such that no two demands have the same working wavelength channel or
3 protection wavelength channel.

1 8. The method of claim 6, wherein the path and wavelength-channel assignments
2 are carried out so as to drive down a cost function determined at least in part by the
3 occupancy of wavelength channels on links of the network.

1 9. The method of claim 8, wherein the cost function is further determined by the
2 occupancy of ports or optical termination units at nodes of the network.

1 10. The method of claim 8, wherein
2 the links of the network comprise optical fibers,
3 the cost function includes, for each link, a cost component for placing a further
4 wavelength channel on such link; and

5 said cost component is selected to decrease as the number of already-placed
6 wavelength channels increases, but to jump to a highest value when the number of
7 already-placed wavelength channels reaches the full capacity of one optical fiber.

1 11. The method of claim 10, wherein the cost function further includes a cost
2 component for placing wavelength ports at end nodes of the link, and the cost component
3 is selected to decrease as the number of already-placed wavelength ports increases, but to
4 jump to a highest value when the number of already-placed wavelength ports reaches the
5 full capacity of one optical cross-connect.

1 12. The method of claim 8, wherein the path and wavelength-channel
2 assignments are carried out such that the assignments to the respective demands jointly
3 drive down the cost function.

1 13. The method of claim 1, wherein the network is an optical network, each link
2 of the network comprises one or more optical fibers, and the method further comprises

3 assigning at least one wavelength channel to each working path and to each protection
4 path.

1 14. The method of claim 1, wherein the network is an optical network, each link
2 of the network comprises one or more optical fibers, and rings having a common link are
3 permitted to share optical fibers on such common link.

1 15. The network of claim 1, wherein:
2 the network is an optical network; each link of the network comprises one or more
3 optical fibers;
4 the method further comprises assigning at least one wavelength channel to each
5 working path and to each protection path; and
6 the assignment of wavelength channels is carried out such that on a given ring, the
7 protection paths of two or more demands are permitted to share the same wavelength
8 channel if the respective working paths of said demands have no common link on the
9 given ring.

1 16. The method of claim 15, wherein:
2 two or more rings having a common link are permitted to share optical fibers on such a
3 common link; and
4 each wavelength channel on such a shared optical fiber belongs exclusively to only one
5 of the sharing rings.

1 17. The method of claim 16, wherein each optical fiber on a given link of a ring is
2 allocated exclusively to one ring.

1 18. The method of claim 15, wherein:
2 at least one of the demands routed in the network is a compound demand having a
3 source node and a destination node and comprising two or more constituent demands
4 each of which begins or ends on a node intermediate the source and destination nodes;

5 the assignment of rings to demands comprises assigning a ring to each of the
6 constituent demands; and
7 a working path or protection path for the compound demand is permitted to pass through
8 links occupied by distinct rings.

1 19. The method of claim 18, wherein the subdividing of the network into rings
2 comprises selecting a working path for each demand, and then defining a set of rings such
3 that every link of the network that is occupied by a working path is also occupied by at
4 least one ring.

1 20. The method of claim 19, further comprising designating to each link of the
2 network sufficient optical working fibers to carry the demands routed on working paths
3 through said link, and designating to each ring a sufficient number of optical protection
4 fibers so that the number of protection fibers occupying each link is at least the number of
5 working fibers occupying said link.

1 21. A method, comprising:
2 detecting a failure at a node or link of a network resulting in the interruption of a
3 routed working path for at least one demand;
4 selecting a protection path for the interrupted demand; and
5 re-routing the interrupted demand along the protection path; wherein:
6 a) the network is logically subdivided into a plurality of rings, each ring formed
7 by two link-disjoint paths between a pair of nodes;
8 b) to each of a plurality of demands, each said demand having a pair of end
9 nodes, there is assigned a ring that contains both of the pertinent end nodes; and
10 c) the selection of a protection path for the interrupted demand comprises
11 selecting a path that belongs to the same ring as the interrupted working path and is link-
12 disjoint therefrom.

1 22. The method of claim 21, wherein the network is an optical network.

1 23. The method of claim 21, wherein the selected protection path is node-disjoint
2 from the interrupted working path.

1 24. The method of claim 21, wherein:

2 at least one of the demands routed in the network is a compound demand having a
3 source node and a destination node and comprising two or more constituent demands
4 each of which begins or ends on a node intermediate the source and destination nodes;

5 for each said compound demand, a ring is assigned to each of the pertinent
6 constituent demands;

7 the interrupted demand is a compound demand; and

8 the selected protection path belongs to the ring assigned to the constituent demand
9 where the failure occurred.
